

ICT COFFEE

DECAF MC

Stock: Out of stock | **Categories:** [Decaf MC](#) |

ADDITIONAL INFORMATION

Bag Size	60 Kg Bags
Grade	Brazil 2/3 SC 14/16
Location	The Green Room
Contract	P116872/1
Record Id	337347.0

The Methylene Chloride (MC) decaffeination process is a common method for removing caffeine from coffee beans. In this technique, green beans are first soaked to open their pores and then treated

ICT COFFEE

with methylene chloride, a solvent that specifically targets and bonds with caffeine. The solvent is then washed off, taking the caffeine with it. This step may be repeated to ensure thorough caffeine removal. The beans are finally dried to their original state. While there are health concerns about methylene chloride, the beans are rigorously cleaned, and the residual solvent is typically within safe, internationally recognized limits. The MC process is popular for efficiently preserving the original flavor and aroma of the coffee.
